Berry Dash Tutorial

A simple Strategy/Casual game.

Understanding how the game works

For Desktop:

Use W, A, S, D or arrow keys to move, space to jump

For Controller:

The joystick can be used in all directions except for down, and use the "A" button to jump.

For On Screen Buttons/Mobile:

Press right or left arrows to move left or right, press the arrow facing up to jump & the reset button to restart.

Understanding how accounts work

Accounts are used for leaderboards in 1.2 and higher. You will need to save your account in the account menu to update any save file changes (stats, icons, etc.) to the server.

You can request your account to be hidden from the leaderboards within the [Discord Server](#).

Settings & Configuration

You can find your settings in the menu, with the options

"Fullscreen", "Show FPS", "Enable VSync", "Hide socials from main menu", "Randomized song order", "Music Volume", and "Sound Effects Volume"

Each setting can be adjusted to how you would like to play Berry Dash.

Note

Since 26.1, accounts have migrated with Lncvrt Games automatically. There is no action required on your end and when you load 26.1 for the first time, if you had a 1.8.2 or lower save file it will be migrated automatically. If you want to play 1.8.2 or lower, save on 26.1, then load on 1.8.2 after logging in again. You can do this in reverse to get it back on 26.1. The save file is automatically converted on the Berry Dash servers.

This document is outdated and hasn't been majorly updated since 1.3.3.
